Getting Studento onto students' devices in New York

Studento is a bell countdown clock. Everything it needs lives on the device. The optional account holds a username and the student's own class names, nothing else. That makes the New York paperwork short, but it still has to be done, and the order matters.

The three things the principal was talking about

1. **Ed Law 2-d.** New York Education Law §2-d is the student-data-privacy law. A district can only use software that touches student data after the vendor signs the district's **Data Privacy Agreement (DPA)**.
2. **Parents' Bill of Rights.** Every DPA must carry a **Parents' Bill of Rights for Data Privacy and Security supplement** that the vendor fills in: what data, why, where it lives, how long, how it is protected, how to complain. That is the "P-something". Ours is drafted in `PARENTS-BILL-OF-RIGHTS-SUPPLEMENT.md`.
3. **Part 121.** NYSED regulation 8 NYCRR Part 121 is the rulebook that says how 2-d is applied (the NIST Cybersecurity Framework, the DPA contents, breach notice within 7 days, staff training). The district's data-protection officer checks vendors against it.

Who decides

Not the principal. Email the district's **Director of Technology** and copy its **Data Protection Officer** (both are named on the district website, usually under Technology or Business Office). `EMAIL-TO-TECH-DIRECTOR.md` is the first message.

How the rollout works, in order

1. **App Store listing is live.** Districts can only push apps that are on the App Store (or delivered as a Custom App through Apple School Manager). TestFlight or sideloading never goes to students. See `../APP-STORE.md` for the submission state.
2. **The district vets the app.** They will ask for: the privacy policy (https://studento-app.pages.dev/privacy), the data inventory and security summary (`DATA-INVENTORY.md`), and the filled-in Parents' Bill of Rights supplement. They send their DPA; you sign it.
3. **Distribution.** The district adds Studento in **Apple School Manager** (Apps and Books, free licenses) and pushes it with their MDM (Great Neck uses Jamf or Mosyle on student iPads).

Students either get it installed automatically or find it in the Self Service app. No accounts are needed for the app to work, so the district can roll it out with accounts off.

4. **Which devices.** New York's bell-to-bell phone ban (2025-26 onward) means students will not be using Studento on phones during school. It has to run on the school-issued device: iPads get the iOS app; Chromebooks need the web version. Ask the tech director which one the building uses before anything else.

What makes this easy for them (say it in the email)

- No names, emails, phone numbers, photos of the student, location, or advertising ID.
- Works fully offline with no account. The account is optional and holds a username only.
- The schedule photo (optional reader) is sent once and never stored.
- Students can delete their account and all data in the app.
- Reports on shared content go to one admin; there is no chat or social feature.
- Data is in the United States (Cloudflare, US data centers), encrypted in transit (TLS) and at rest; passwords hashed with PBKDF2-SHA256.
- Free. No in-app purchases, no ads, no third-party trackers.

If they want the Chromebook version

The same app can ship as a web app at studento-app.pages.dev (sign-in, schedules and the reader already run there). Say so if asked; it is a day of work to match the iOS screens.
